

# Binary and Hex Representations: Text, Images, Music, Videos, ....

# Computers “communicate” in Base 2 (binary)

Early computers had switches made from vacuum tubes. The invention of the transistor in the 1950s started a revolution in creating smaller, faster and cheaper computers.

The reduction of decimal to binary does increase the length of the number, but this is more than made up for in the increase in speed, memory and utilisation.

# Decimal System - Base 10

- Ten symbols: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9
- These symbols are called digits
- We represent numbers with place value notation:  
1's place, 10's place 100's place, ...
- $2573 = 2 \times 1000 + 5 \times 100 + 7 \times 10 + 3 \times 1$   
 $= 2 \times 10^3 + 5 \times 10^2 + 7 \times 10^1 + 3 \times 10^0$

$10^3$	$10^2$	$10^1$	$10^0$

# Conversions...

1	1	0	1
$2^3$	$2^2$	$2^1$	$2^0$

Binary - 1101 represents 13 in Base 10 (Base 2 to Base 10/Decimal)

5	2	3
$8^2$	$8^1$	$8^0$

Octal- represents 339 in Base 10 (Base 8 to Base 10/Decimal)

2	5	4
$6^2$	$6^1$	$6^0$

Base 6 - represents 106 in Base 10

## Conversion from decimal to binary:

$$\begin{array}{r} 2 \overline{)156} \\ 2 \overline{)78} \\ 2 \overline{)39} \\ 2 \overline{)19} \\ 2 \overline{)9} \\ 2 \overline{)4} \\ 2 \overline{)2} \\ 2 \overline{)1} \end{array}$$

Remainder:

0  
0  
1  
1  
1  
0  
0  
1

$$156_{10} = 10011100_2$$

# Try It - Convert Dec to Bin

3. 204

4. 367

5. 1567

## Conversion from decimal to binary: Method 2 - Descending powers of 2

156<sub>10</sub>

128	64	32	16	8	4	2	1
-----	----	----	----	---	---	---	---

$$156 - 128 = 28$$

156<sub>10</sub>

128	64	32	16	8	4	2
-----	----	----	----	---	---	---

1 0 0

$$156 - 128 = 28$$

156<sub>10</sub>

128	64	32	16	8	4	2	1
-----	----	----	----	---	---	---	---

1 0 0 1 1 1 0 0

$$156 - 128 = 28$$

$$28 - 16 = 12$$

$$12 - 8 = 4$$

$$4 - 4 = 0$$

# Convert Dec to Bin with Method 2

2. 7

3. 2

4. 14

5. 6

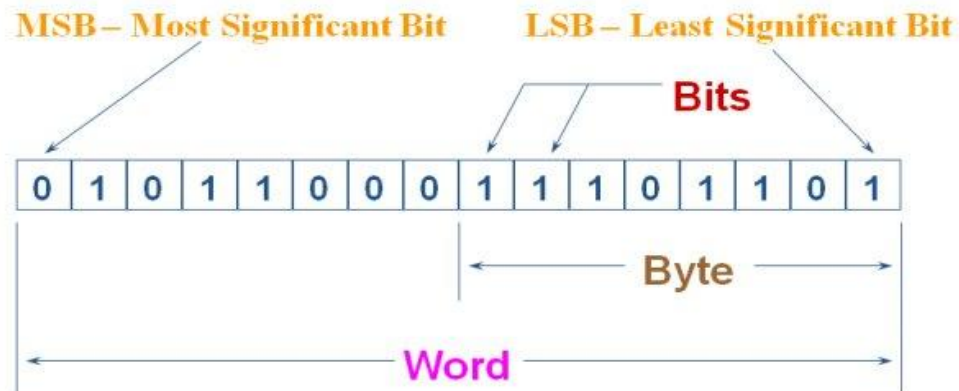

# Convert Bin to Dec

1. 1111
2. 101100
3. 10111
4. 110
5. 101

# Bits, Bytes, Words

Computers work with fixed sized bit sequences:

- Bit -> 0 or 1
- Byte = 8 bits
- Computer Word = several bytes
- Common word sizes on modern computers are
  - 32 bit words (4 bytes)
  - 64 bit words (8 bytes)

# Some Useful Facts

- We can represent  $10^n$  numbers with  $n$  digits
  - Ex: with two digits numbers 0, 1, ..., 99
  - Note that  $99 = 10^2 - 1$
- We can represent  $2^n$  numbers with  $n$  bits
  - Ex: with 8 bits (one byte) : 0, 1, ..., 255
  - Note that  $255 = 2^8 - 1$
- Binary numbers that end in 0 are even; those that end in 1 are odd

**“There are 10 kinds of people in the world: those who understand binary and those who don’t!”**

# Hexadecimal (base 16)

- Binary numbers can be impractical  
1100101001000100011101011001100111010
- Base 16 is convenient because 16 numbers can be represented with 4 bits: 0000 to 1111 (also known as 0 to 15). They always start with 0x.
- But we don't have enough digits to represent all 16 of these symbols  
So, how do we do that??

# WE USE LETTERS !

Sixteen symbols: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, F

$0x2AB3 = 2 \times 16^3 + 10 \times 16^2 + 11 \times 16^1 + 3 = ?$  (Ask Python!)

Binary	Hex	Decimal
0000	0	0
0001	1	1
0010	2	2
0011	3	3
0100	4	4
0101	5	5
0110	6	6
0111	7	7

# Importance of Binary

- Text, photos, music, video, get encoded into bytes that are represented in binary (and more easily readable in hex).
- For each type of media there are (several) standard representations
  - Text characters: ASCII, UTF-8, others
  - Images: jpg, png, bmp, ...
  - Music: mp3, midi ...

# ASCII

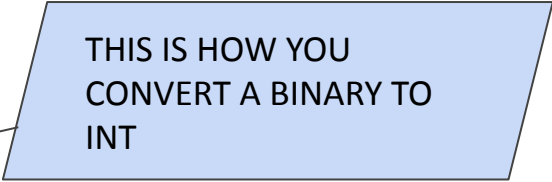

- Each character (letter, digit, punctuation mark, space, tab, ...) corresponds to a number.
- Original ASCII uses 7 bits to represent 128 different characters.
- Python uses an extension of ASCII called UTF-8 (but we'll just call it ASCII)
- Capital letters start at decimal 65 with 'A'
- 'A' : 65 : 01000001 : 41 (hex)
- 'B' : 66 : 01000010 : 42 (hex)

# Conversion Using Python

## Binary to Hexadecimal

```
binary_string = "1010"
```

THIS IS HOW YOU  
CONVERT A BINARY TO  
INT

```
decimal_representation = int(binary_string, 2)
```

```
hexadecimal_string = hex(decimal_representation)
```

```
print(hexadecimal_string)
```

# Conversion Using Python

## Decimal to Binary

```
binary = int(input('enter a number: '))  
print(bin(binary))
```

# REMEMBER THESE HACKS:

## 1. ANY NUMBER SYSTEM

### CONVERTING TO DECIMAL ->

Write powers of the base from right to left, multiply with digits and add

## 2. DECIMAL TO ANY NUMBER SYSTEM ->

Repeatedly divide by the base of the number system, write the remainders from bottom to top

## 3. BINARY TO HEX->

Groups of 4 bits and then just write in hex!
